BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

- ☐ **BLACK BORDERS**
- ☐ **IMAGE CUT OFF AT TOP, BOTTOM OR SIDES**
- ☐ **FADED TEXT OR DRAWING**
- ☐ **BLURRED OR ILLEGIBLE TEXT OR DRAWING**
- ☐ **SKEWED/SLANTED IMAGES**
- ☐ **COLOR OR BLACK AND WHITE PHOTOGRAPHS**
- ☐ **GRAY SCALE DOCUMENTS**
- ☐ **LINES OR MARKS ON ORIGINAL DOCUMENT**
- ☐ **REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY**
- ☐ **OTHER:** _____

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.

PHAM, CHRYSTINE

ART UNIT PAPER NUMBER

2122

DATE MAILED: 08/27/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No.	Applicant(s)	
	09/972,076	JOHNSON ET AL.	
	Examiner	Art Unit	
	Chrystine Pham	2122	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 05 October 2001.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-79 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☒ Claim(s) _____ is/are allowed.
- 6) ☐ Claim(s) 1-47, 49-70, 72-79 is/are rejected.
- 7) ☒ Claim(s) 48 and 71 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 05 October 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Specification

1. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 32-33, 37-39, 46, 53-56, 60-62, 69, 76-79 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

A broad range or limitation together with a narrow range or limitation that falls within the broad range or limitation (in the same claim) is considered indefinite, since the resulting claim does not clearly set forth the metes and bounds of the patent protection desired. Note the explanation given by the Board of Patent Appeals and Interferences in *Ex parte Wu*, 10 USPQ2d 2031, 2033 (Bd. Pat. App. & Inter. 1989), as to where broad language is followed by "such as" and then narrow language. The Board stated that this can render a claim indefinite by raising a question or doubt as to whether the feature introduced by such language is (a) merely exemplary of the remainder of the claim, and therefore not required, or (b) a required feature of the claims. Note also, for example, the decisions of *Ex parte Steigewald*, 131 USPQ 74 (Bd. App. 1961); *Ex parte Hall*, 83 USPQ 38 (Bd. App. 1948); and *Ex parte Hasche*, 86 USPQ 481 (Bd. App. 1949). For example, claim 37 recites the broad recitation "said at least one domain expert comprising any of, but not limited to:" (line 2-3), and the claim also recites "a client; a partner; and

a consultant" (line 4-6) which is the narrower statement of the range/limitation. Claim 38 also recites the broad recitation "said at least one model is any combination of, but not limited to:" (line 1-2), and the claim also recites "expert; judgement; pooled; custom predictive; and decision;" (line 3-7) which is the narrower statement of the range/limitation. Numerous other claims (e.g., claims 39, 46, 53, 60-62, 69, 76, and 79) also recite broad limitations, which are followed by narrow limitations, hence are rejected for the same reasons as cited above.

Claim 32 recites the limitations "apparatus of Claim 23" in line 1. There is insufficient antecedent basis for this limitation in the claim. For compact prosecution of the application, the office has treated claim 32 after giving said limitations the correct interpretation which is "apparatus of claim 26".

Claim 33 recites the limitations "apparatus of Claim 18" in line 1. There is insufficient antecedent basis for this limitation in the claim. For compact prosecution of the application, the office has treated claim 33 after giving said limitations the correct interpretation which is "apparatus of claim 26".

Regarding claims 38 and 61, the phrase "and the like" (see claim 38 line 9, and claim 61 line 9) renders the claim(s) indefinite because the claim(s) include(s) elements not actually disclosed (those encompassed by "and the like"), thereby rendering the scope of the claim(s) unascertainable. See MPEP § 2173.05(d).

As per claims 54-56, 77-78, they are also rejected under 35 U.S.C 112 second paragraph as claims depending on rejected base claims 53 and 76, respectively.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1, 2, 4-5, 9, 10, 12-13, 17, 34-37, 42-47, 50, 52 and 57 are rejected under 35 U.S.C. 102(b) as being anticipated by Courts et al. (US 6085220), hereinafter, *Courts et al.*.

As per claim 1, *Courts et al.* teach an apparatus (e.g., see Abstract, *enterprise interaction hub 10* FIG.1 & associated text) and method (e.g., col.1:45-49) for an all-purpose decision service/server/engine returning a real-time decision in ASP mode to an end user/client (e.g., col.3:24-27 & 34-35, col.7:38-46, col.9:30-35), said method comprising:

- linking to a first computer system having project design software (e.g., see *business layer 16* FIG.1 & associated text) via the Internet or a virtual private network (e.g., see *DCOM* FIG.1) for designing rules/models (e.g., see *business logic & business object 20* FIG.1 & associated text);
- passing control (e.g., see *integration layer 18* FIG.1 & associated text) to a code generator server (e.g., see *Independent Software Vendor ISV space 28* FIG.1 & associated text) for generating code for use in production in said ASP environment (e.g., col.2:62-67);
- said code generator server generating strategy service software for installation on a decision engine/server which is embeddable in a software application (e.g., see *presentation layer 14 & render object/engines 20* FIG.1, see *render engines 122* FIG.2 & associated text, see *Rengine.PBD 130 & application code PBDs 132* FIG.2B & associated text) for executing said rules/models (e.g., col.1:56-58, col.6:52-54);

- sending input data to said decision server via a Web server (e.g., see Abstract, see *interaction layer 12 & HTTP* FIG.1 & associated text, col.9:30-32), said input data for processing using said decision server;
- said decision server processing said input data according to said installed rules, models (e.g., col.1:56-58, col.3:51-52) and creating corresponding output data/calculated results/actions (e.g., see *html generation* FIG.1 & associated text);
- said decision server returning said created output data to said Web server in XML format (e.g., col.4:13-16); and
- said Web server returning said output data (e.g., see Abstract, col.1:52-54).
- a transaction log of said automated real time decisions, said log accessible by a client (e.g., col. 4:39-40 & 47-48).

As per claim 2, *Courts et al.* teach the method as applied to Claim 1, further comprising:

- using system integration (e.g., see *integration layer 18* FIG.1 & associated text) and consulting services (e.g., see *trend DB 36 & profile DB 38 & enterprise space 26* FIG.1 & associated text), said consulting services for developing and refining rules, models, and strategies (e.g., col.1:61-col.2:4, col.3:3-8).

As per claim 4, *Courts et al.* teach the method as applied to Claim 1, wherein said decision server is linked to external data resources for extracting additional relevant data (e.g., see *profile DB 38 & enterprise space 26* FIG.1 & associated text).

As per claim 5, *Courts et al.* teach the method as applied to claim 1 wherein an ASP file running on a Web server passes input data to said decision server (e.g., col.3:18-24), said input data is in XML format (e.g., col.4:13-16).

As per claim 9, *Courts et al.* teach an apparatus for a decision service returning a real-time decision in ASP mode to an end user (see claim 1), said apparatus comprising:

- means for linking to a first computer system having project design software (e.g., see *business layer 16* FIG.1 & associated text) via the Internet or a virtual private network (e.g., see *DCOM* FIG.1) for designing rules/models (e.g., see *business logic & business object 20* FIG.1 & associated text);
- means for passing control (e.g., see *integration layer 18* FIG.1 & associated text) to a code generator server (e.g., see *Independent Software Vendor ISV space 28* FIG.1 & associated text) for generating code for use in production in said ASP environment (e.g., col.2:62-67);
- means for said code generator server generating strategy service software for installation on a decision server (e.g., see *presentation layer 14 & render object/engines 20* FIG.1, see *render engines 122* FIG.2 & associated text, see *Rengine.PBD 130 & application code PBDs 132* FIG.2B & associated text) for executing said rules/models (e.g., col.1:56-58, col.6:52-54);
- means for sending input data to said decision server via a Web server (e.g., see Abstract, see *interaction layer 12 & HTTP* FIG.1 & associated text, col.9:30-32), said input data for processing using said decision server;
- means for said decision server processing said input data according to said installed rules/models (e.g., col.1:56-58, col.3:51-52) and creating corresponding output data (e.g., see *html generation* FIG.1 & associated text);
- means for said decision server returning said created output data to said Web server in XML format (e.g., col.4:13-16); and
- means for said Web server returning said output data (e.g., see Abstract, col.1:52-54).

Art Unit: 2122

As per claims 10, 12, and 13, they recite limitations, which have been addressed in claims 2, 4, and 5 respectively, therefore, are rejected for the same reasons as cited in claims 2, 4, and 5.

As per claim 17, *Courts et al.* teach a method for assembling and delivering an all-purpose decision engine/server in ASP mode, said method comprising:

- defining input and output structures in XML format (e.g., see claim 5).
- importing analytical models (e.g., see claim 1).
- adding rules, modifying decision actions (e.g., col.5:10-13), and general tweaking of said engine (e.g., see _business layer 16, business objects 22 FIG.1 & associated text).
- testing [rules within] said engine (e.g., col.4:7-9).
- fueling said engine with data from a variety of sources and said engine delivering decisions (see claim 4).

As per claims 34-37, 42-47, 50, 52, and 57, they recite limitations which have been addressed in claims 2, 4, 5, and 17, therefore, are rejected for the same reasons as cited in claims 2, 4, 5, and 17.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 2122

7. Claims 3 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Courts et al.* as applied to claims 1 and 9 above, and further in view of *Dodrill et al.* (US 6490564), hereinafter, *Dodrill et al.*.

As per claim 3, *Courts et al.* teach the method as applied to claim 1 wherein software components are implemented using programming languages such as J++, PB, VB, Delphi, or C++ (e.g., 44 FIG.1 & associated text). *Courts et al.* do not expressly disclose generating code in C. However, *Dodrill et al.* discloses a method and apparatus (e.g., see *application server 66* FIG.3, 4 & associated text) for decision service returning a real-time decision (e.g., col.2:58-64) in ASP mode to an end user (e.g., see *thin clients 42b & browser 56* FIG.4 & associated text, see Abstract, col.2:44-51) wherein the user input (e.g., see *300 & 302* FIG.9 & associated text) is sent to decision server via a Web server (e.g., see *Web Server 64* FIG. 4 & associated text) and processed by the decision server according to installed rules (e.g., col.5:46-50), and corresponding XML-formatted output data (e.g., see *dynamic HTML/XML pages 98* FIG.4 & associated text) is generated and returned from decision server to Web server to be transmitted to end user. *Dodrill et al.* further discloses a method and apparatus as described above wherein applications/logic/functions/code (e.g., see *application 48* FIG.2 & associated text) are written in programming language C (e.g., col.2:58-60) and formatted in CGI (e.g., col.2:61-63). It would have been obvious to one of ordinary skill in the pertinent art at the time the invention was made to substitute the programming languages disclosed in the teaching of *Courts et al.* with C to produce the expected result with reasonable success. And the motivation for doing so would have been the well-known characteristics/advantages associated with the C language, namely, small size (i.e., few built-in functions) which allows flexibility and power in programming and building/customizing the language for a specific application, portability (i.e., compiled on various computer systems), and capacity for implementing system software/low-level tasks such as transferring data and integrating system components, loading programs, and formatting text for display, etc.,.

As per claim 11, it recites limitations which have been addressed in claims 9 & 3, therefore, is rejected for the same reasons as cited in claims 9 & 3.

8. Claims 6-8, 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Courts et al.* as applied to claims 1 and 9 above, and further in view of Humpleman et al. (US 6466971), hereinafter, *Humpleman et al.*.

As per claim 6, *Courts et al.* teaches the method as applied to claim 1. *Courts et al.* do not expressly disclose code generator server generating an XML schema for providing to a client system for collecting said input data and said code generator server generating an XML parser/builder for reading data conforming to said XML schema. However, *Humpleman et al.* discloses a method and apparatus (e.g., see Abstract, FIG.14, 19 & associated text) for sending XML input data (e.g., see *commands/XML* FIG.14 & associated text, see *XML-RPC Action* FIG.19) from an end user/client system (e.g., see A FIG. 14 & associated text, see *HN Device A: Controller Module* FIG.19 & associated text) to a decision server (e.g., see S FIG.14 & associated text, see *HN Device B: Controller Module* FIG.19 & associated text) via a web server (e.g., see *server 14* FIG.14 & associated text, see *HN Device Web Server 86* FIG.19 & associated text), said decision server processing the XML input data, generating XML-formatted response, web pages and returning to the client via said web server (e.g., see *HTML or XML* FIG.14, see *XML-RPC Response* FIG.19 & associated text). *Humpleman et al.* further discloses generating an XML schema for providing to the client system for collecting said input data and providing to Web server for use in error handling, or data validation (e.g., see *CALL.DTD & INTERFACE.DTD & Web Server Layer* FIG.18 & associated text, see *Device A XML Interface 72* FIG.19 & associated text) and generating an XML parser (e.g., see *XML Layer IN 70 & XML Layer OUT 68* FIG.18 & associated text, see *XML parser 74* FIG.19 & associated text) for reading data conforming to said XML schema. It would have been obvious to one of ordinary skill in the

pertinent art at the time the invention was made to modify *Courts et al.*'s teaching to include the teaching as set forth by *Humpleman et al.* to produce the expected result with reasonable success. And the motivation for doing so would have been that the formatting of data into syntactically correct XML document(s) depends upon adhering to a predefined definition language describing the structure and set of constraints (i.e., XML schema) on which an XML documents shall be constructed from said data. Furthermore, XML parsers enable the processing and extracting of data in textual representation within XML tags and transforming them into specific-typed objects/data structure (e.g., C, C++, or Java objects) which can be retrieved for use by servers and software applications. Conventional XML parsers check XML documents being parsed for conformance to general XML rules. Most recent XML parsers, at the time the invention was made, are implemented with integrated support for XML schemas to further enable data validation.

As per claims 7-8, 14-16, they recite limitations which have been addressed in claim 6, therefore, are rejected for the same reasons as cited in claim 6.

9. Claims 18-19, 23-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Courts et al.*, and further in view of Marullo et al. (US 6157940), hereinafter, *Marullo et al.*.

As per claim 18, *Courts et al.* teach a method and apparatus for an end user to develop rules, models, and/or strategies, for generating real time decisions in ASP mode (see claim 1), said method comprising:

- o using a proprietary custom predictive analytics for outputting a models file of resulting rules by taking historical data as input (e.g., see *trend DB 36, profile DEB 38, trend data collection 32, business layer 16* FIG.1 & associated text);
- o providing a designer component, said designer component providing means for designing rules, models, and strategies by using a project design (see claim 1);

- storing said project design in a projects repository for future reference (e.g., see *project database 148* FIG.2B & associated text);
- generating production code for executing in production mode (e.g., see claim 3).

Courts et al do not expressly disclose generating a runtime version of said project design for testing, said testing thereby validating and verifying said rules; stress testing said rules/models by inputting a significantly large number of transactions into a monitor and Web server; said Web server generating a bulk test report representing results of said stress testing; modifying said rules, models, and strategies, if necessary as a result of said stress testing. However, *Marullo et al.* disclose an apparatus (e.g., see FIG.2 & associated text, FIG.3 & associated text) and method of stress testing business/web-server applications or functional areas within vertical markets (e.g., see Abstract, *commercial on-line banking and shopping transactions* col.1:30-31, see *banking application 12* FIG.1 & associated text, see *banking application 32* FIG.2 & associated text), said apparatus and method comprising:

- generating a runtime version of said project design and marking said project (e.g., col.32:29-31) for testing (e.g., see *genautoAPI 58* FIG.2 & associated text, col.2:31-37, col.4:2-6, col.7:4:9 & 12-17), said testing thereby validating and verifying said rules (e.g., see FIG.13A, 13B & associated text, col.1:5-10, col.2:14-15 & 18-31, col.3:54-55 & 60-65);
- stress testing said rules/models (e.g., col.3:38-43, col.4:40-47, col.6:1-6 & 51-62, see *webStrain 68* FIG.2 & associated text, see 352 FIG.18 & associated text, see FIG.16A-16C & associated text) by inputting a significantly large number of transactions into a monitor and Web server (e.g., see *web server 10* FIG.1 & associated text, col.1:43-47, see *genautoAPI 58* FIG.2 & associated text, see 106 FIG.15 & associated text);
- said stress testing tracking and storing in repository (e.g., see *user specified files 40* FIG.3 & associated text) statistics on specific rules/models by counting the number of times predetermined rules/models are used during said stress testing (e.g., see 116, 118 FIG.9A & associated text, col.2:65-col.3:6,);

- o said Web server generating a bulk test report representing results of said stress testing (e.g., col.3:15-21, see *Reports 114* FIG.8 & associated text, see 360 FIG.18 & associated text);
- o modifying said rules/models if necessary as a result of said stress (e.g., col.3:38-43, col.4:40-47, col.6:1-6 & 51-62, see *webStrain 68* FIG.2 & associated text, col.1:5-10, col.2:14-15 & 18-31, col.3:54-55 & 60-65);

It would have been obvious to one of ordinary skill in the pertinent art at the time the invention was made to incorporate the teaching of *Marullo et al.* into that of *Courts et al* (hereinafter *CM*) to include the steps of stress testing rules/models as disclosed by *Marullo et al.* which would produce the expected result with reasonable success. And the motivation for doing so would have been that the automation of stress testing business/web-server applications (i.e., project design), verification/validation of rules/models, and report generation ensures that all possibilities of data input/output and all permutations and combinations of transactions/APIs and business logic/rules associated therewith have been exhaustively traversed, and tested for correctness and reported in a consistent, and efficient manner [in comparison to manual testing/traversing of links in web applications which yields unreliable test results not mirroring what is to be expected in the actual environment in which the web server applications would be used].

As per claims 23-26, they recite limitations which have been addressed in claim 18, therefore, are rejected for the same reasons as cited in claim 18.

10. Claim 20 is rejected under 35 U.S.C. 103(a) as being unpatentable over *CM* as applied to claim 18 above and further in view of *Ballantyne et al.* (US 6687873), hereinafter, *Ballantyne et al.*.

As per claim 20. *CM* teaches the method of claim 18. However *CM* does not expressly disclose providing a model editor component for automatically converting said models file into an XML version of said rules, and importing said converted XML data into said designer component.

However, *Ballantyne et al.* disclose a method (e.g., see abstract) and apparatus (e.g., see FIG.1 & associated text) of providing a model editor component (e.g., see *modeling engine 28, mapping engine 26, modeling/mapping GUI 30* FIG.1 & associated text) for automatically converting said rules/models file (e.g., see Abstract, see *legacy program applications 16* FIG.1 & associated text, see *36* FIG.2 & associated text) into an XML version of said rules/models (e.g., see *context table 22* FIG.1 & associated text, see *44* FIG.2 & associated text) and importing said converted XML data into said designer component (e.g., see *legacy system 12, writer engine 20* FIG.1 & associated text). It would have been obvious to one of ordinary skill in the pertinent art at the time the invention was made to incorporate the teaching of *Ballantyne et al.* into that of *CM* to obtain a model editor component for automatically converting rules/models files in to XML format which are then imported to the designer component with reasonable success in producing the expected results. And the motivation for doing so would have been that automatic conversion of business rules/models into XML format eliminates the need to alter existing programming logic or business rules within legacy applications and further facilitates easy data transmission over the Internet, and between different applications, as well as direct display and manipulation of data via browser technology.

11. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over *CM* as applied to claim 18 above and further in view of Kendall et al. (US 2002/0138449), hereinafter, *Kendall et al.*.

As per claim 21, *CM* teaches the method of claim 18. *CM* does not expressly disclose said designer component further comprising providing designing software having graphical user interfaces for generating data, variables, rules, models, strategies, trees, and actions required in said project design. However, *Kendall et al.* disclose a method and apparatus (e.g., see FIG.1 & associated text) for providing a designing software having graphical user interfaces (GUIs) for generating data, variables, business rules/models, trees, and actions required in a project design (e.g., see Abstract, see FIG.5,6,9 & associated text). *Kendall et al.* further discloses generating

for the project design a workflow functional component (e.g., see FIG.7,8 & associated text) having expression sequences (e.g., see *policy number, address, city, caller name* FIG.10 & associated text), segmentation trees (e.g., see *Driver is named on policy, police have been notified, injuries as a result of accident* FIG.5 & associated text), workflow lists (e.g., see FIG.5,9,10 & associated text) for means for placing said sequences, trees, and lists in a hierarchical order (e.g., (e.g., see FIG.5,9,10 & associated text) wherein a root workflow list (e.g., see *lost type is accident* FIG.5 & associated text) providing a starting point for processing workflow at runtime, and any of said workflow lists is used as a result list at an exit point of segmentation tree of said segmentation trees (e.g., see *outcome* FIG.6 & associated text), and wherein end result nodes of said segmentation tree points to said workflow list (e.g., see FIG.5,9,10 & associated text). It would have been obvious to one of ordinary skill in the pertinent art at the time the invention was made to incorporate the teaching of *Kendall et al.* into that of *CM* to obtain a designing software having GUIs for generating data, variables, business rules/models, trees, and actions required in a project design. And the motivation for doing so would have been to enable the development and modification of evolving business logic/rules/models/actions by ordinary administrators/end-users without any computer programming experience and graphical displays of business rules/models/actions in forms of workflow lists, segmentation trees, and expression sequences further enable fast and easy analysis and/or modification of said rules/models/actions.

12. Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over *CM* as applied to claim 18 above and further in view of Bertrand et al. (US 6018732), hereinafter, *Bertrand et al.*.

As per claim 22, *CM* teaches the method of claim 18, wherein rules are tested (see claim 17). *CM* does not expressly disclose providing a test service whereby said rules are tested in runtime mode, said test service comprising a wrapper for a control panel and for an Excel testing program. However, *Bertrand et al.* disclose a method and apparatus for returning real-time

decisions/scores/calculated results in ASP mode (e.g., see Abstract, see FIG.2 & associated text), which is applicable to functional areas of vertical markets (e.g., see *domain model* FIG.6 & associated text, see FIG.15, 16, 34, 75 & associated text, see col.21:15-32), wherein rules are tested in runtime mode by a test service comprising a wrapper (e.g., see *presentation 210, activity 220* FIG.2 & associated text, see col.21:55-62, FIG.8 & associated text) for a control panel and for an Excel testing program (i.e., a model editor for validating and verifying content of rules/models) (e.g., see *simulation engine 270, simulation models 260* FIG.2 & associated text). *Bertrand et al* further disclose a model comprising an expert and decision (e.g., see Abstract) wherein the model predicts revenue (e.g., col.11:23-32) and scores (e.g., see *interest rate, balance* FIG.49 & associated text). It would have been obvious to one of ordinary skill in the pertinent art at the time the invention was made to incorporate the teaching of *Bertrand et al.* into that of *CM* to obtain runtime test service comprising a wrapper for a the control panel and for an Excel testing program. And the motivation for doing so would have been that the usage of Excel spreadsheets in the test service/program enables business logic/rules/functions to be collected, and simulated for testing purpose. Furthermore, Excel can be configured to enforce data constraints and perform numerical calculations on data stored therein.

13. Claims 27-33, 38-41, 49, 56, 58-70, 72-79, they recite limitations which have been addressed in claims 2-6, and 17-22, therefore, are rejected for the same reasons as cited in claims 2-6, and 17-22.

Allowable Subject Matter

14. Claims 48, and 71 are objected to as being dependent upon a rejected base claims 34, and 57, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

Art Unit: 2122

15. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chrystine Pham whose telephone number is 703.605.1219. The examiner can normally be reached on Mon-Fri, 8:30am-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tuan Q Dam can be reached on 703.305.4552. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
